

DAY-1

1.List three real-life scenarios where a multimeter would be used to troubleshoot a computer or smartphone issue, and explain in one line how the multimeter helps in each case.

Scenario	How the Multimeter Helps
Desktop PC is not turning on	It checks if the power supply is giving the correct voltage.
Smartphone is not charging	It checks if the charger or charging cable is supplying power.
Laptop battery problem	It measures the battery voltage to see if the battery is working properly.

**2.Watch a short YouTube video demo of a POST card in action (search for 'POST card motherboard test'), then write a brief summary (3-4 lines) describing what the POST card displays and what problem it helped identify in the video.

Hint: Focus on the codes shown and how they relate to hardware issues..**

The POST card displayed POST error codes while the motherboard was starting. The technician matched the code with the motherboard manual to find the problem. The code showed a RAM (memory) issue, so the RAM was removed and reinstalled. After fixing the RAM, the computer booted successfully.

**3.Download and install any free software diagnostic tool (such as HWMonitor, Speccy, or CrystalDiskInfo), run it on your laptop or desktop, and take a screenshot of the main dashboard showing system health details.

Constraint: Blur or crop out any personal information before submitting.**

4. Compare the use of a multimeter, POST card, and software diagnostics by creating a table with three columns (Tool, What it checks, Example Problem Detected) and fill in at least one example for each tool.

Tool	What it Checks	Example Problem Detected
Multimeter	Checks voltage, current, and continuity in electrical components.	Finds a faulty power supply or dead laptop battery.
POST Card	Displays motherboard POST (Power-On Self-Test) error codes during startup.	Detects RAM, CPU, or motherboard startup problems.
Software Diagnostics (HWMonitor, Speccy, CrystalDiskInfo)	Checks system health, hardware information, temperatures, and disk status.	Detects overheating, low disk health, or hardware performance issues.
